Chaos and Time-Series Analysis

Julien Clinton Sprott, Department of Physics, University of Wisconsin, Madison

- Clear concepts with minimal mathematics, over 250 figures

- Summary of about 50 common chaotic systems

- Many new examples of simple chaotic systems and applications

- Practical methods for finding chaos in experimental data

- Linked to web page with additional information and much more

Contents: Preface; Introduction; One-dimensional maps; Nonchaotic multidimensional flows; Dynamical systems theory; Lyapunov exponents; Strange attractors; Bifurcations; Hamiltonian chaos; Time-series properties; Nonlinear prediction and noise reduction; Fractals; Calculation of fractal dimension; Fractal measure and multifractals; Nonchaotic fractal sets; Spatiotemporal chaos and complexity; Common chaotic systems; Useful mathematical formulas; Journals with chaos and related papers; Bibliography; Index.

0-19-850840-9 | 528 pages | Paperback £26.00/$49.50
0-19-850839-5 | Hardback £60.00/$120
